Green Roofs

Green roofs are becoming increasingly popular. They can be installed on flat roofs or roofs with a slope of up to 45 degrees.

Benefits of Green Roofs

The UK government has been increasingly encouraging sustainable development, and green roofs offer an appropriate alternative to other forms of roofing.

Green roofs add a layer to a property which increases thermal insulation. Allowing the building to stay at particular temperatures throughout the year, effectively reducing energy costs.

Green roofs provide natural habitat for bird, plant and insect life.

Green roofs can make up for the loss of previous greener landscapes, and help to make the overall look of a building more attractive and blend more easily into a surrounding environment.

Green roofs help to reduce noise., absorbing sound as opposed to reflecting it, like most conventional roofs. The soft layer of sedum blanket growing on a green roof also improves the buildings sound insulation.

 *Eco Friendly*

Green roofs also alleviate flooding. Following heavy rain fall, a green roof will retain the rain allowing localised flooding to reduce, and help to keep rain in the natural water cycle and so less in the sewage systems.

Different types of Green Roofs

An extensive Green Roof requires rather low or no maintenance, planted with sedum which is highly adapted to the UK climate and is designed to look after itself for the majority of the year.

A Wild Flower Green Roof is an extensive green roof but planted with a wild flower mix, a natural habitat for wild life. Creating a more attractive and colourful appearance.

More about green roofs!

The cooling affect of the green roof can actually improve the efficiency of the panels. Research has shown that green roofs and solar panels are complementary. Photovoltaic cells placed over a green roof have a higher voltage output, and the environment for the vegetation below the cells are less stressful so habitat becomes more bio diverse.

Massive Cost Savings

Is your roof ready to be green?

Once a waterproof membrane is put down, then a green roof can be put on either flat roofs or a pitch. You would need to get advice from our team as to what is suitable for your roof.

Overall, green roofs are becoming more and more popular and will not only attract wildlife back, but provide cleaner air offsetting our carbon footprint and helping with fighting against Global Warming.
